Mini-Lesson on Low Resistance Liquidity

With these type of videos I want to train your eye to spot specific signatures in price (same with yesterday's video on FVG's).

Low resistance forms when price is held in a range, or after a one-sided expansion price starts pulling back into the range slowly. When there's lack of Liquidity runs or actual clear direction in price (equal lows/highs) that's where LQ is being built.

Price will visit those areas later and collect the liquidity before going for a major move.

Expansion lower

This is not a LQ run, price went under for 1 day. These are clear Equal lows here.

SSLQ

Then notice how price slowly, steadily, creeps into this bearish range forming smallness. They moved - this is further SSLQ there.

What would change it?

Clear LQ raid before pushing higher, that would clear the LQ and from there there's less so to say "need" for price to go over again until price reaches expanding. Pick it higher and then move with it. In this case, as it didn't happen the initial resistance was very small. Price rose as price after the move lower kept on building all this minute Liquidity, which dropped price lower.

Strong enough to cause a shift in delivery

Low Res BS LQ

Price retraces & leaves Low Res LQ here.

Price launches towards Low Res BS LQ higher

SSLQ raid into PDA

Raided + expansion right away no Low-Res LQ

Tiny SSLQ run

Now let's focus on what happened here.
