

TIPS !!!!!

GM @IH - I see what you mean, that was a 100% good call there, mate.
Whenever price's on the parent TF run (in this case 60m) a lot of the time we

will see these 2/5min orderflow expansions where price on the execution TF's just keeps on going rejecting every FVG/OB that it leaves behind i.e. this usually happens when price reaches the second half and mainly the last quadrant of the whole MMXM range (doesn't have to always be a MMXM) or gets close to a particular clear target like in this case on EU, it stops giving large complex structures, stops giving traps and just keeps on climbing till it reaches it, this is why we super rarely see price give lots of mess right before it hits a clear area we target, price does that either in the beginning phases before the expansion and or around EQ, once it goes above EQ and even reaches the last quadrant that's where the one-sided moves happen, how to know that - we measure the the parent TF range (the BSLQ target you had to the main low added an example below), so now when we spot such situations and can see a clear target and that there's still some space for us to squeeze a quick scalp in - that's a totally a valid move to take, however, once price reaches that clear parent TF level/PDA etc, from execution TF POV that's the same as hitting the OC in MMXM situation, we reach a no man's land so to say / a barrier for us that more often than not will turn into a catalyst for a complex stop running structure to form again before it reverses or gives a bear-trap and starts moving again. So yeah mate, you made a 100% right call there looking for moves targeting that level and stepping aside once it was hit. Hope this gives a bit better look on the whole development.

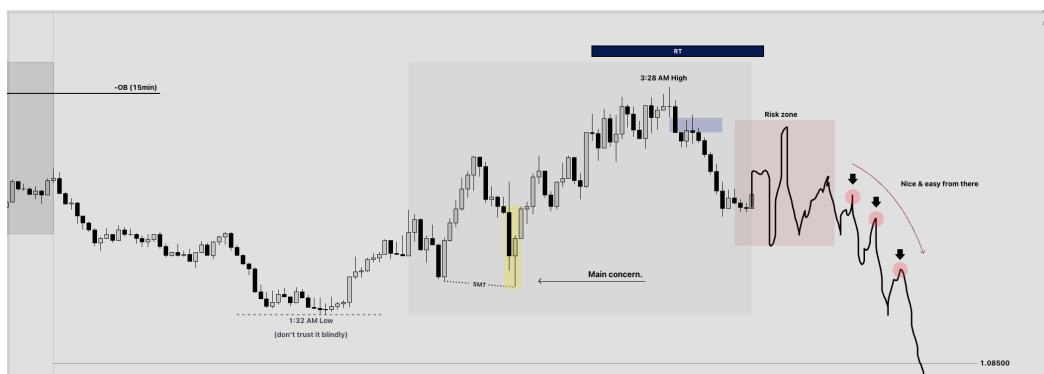

(edited)

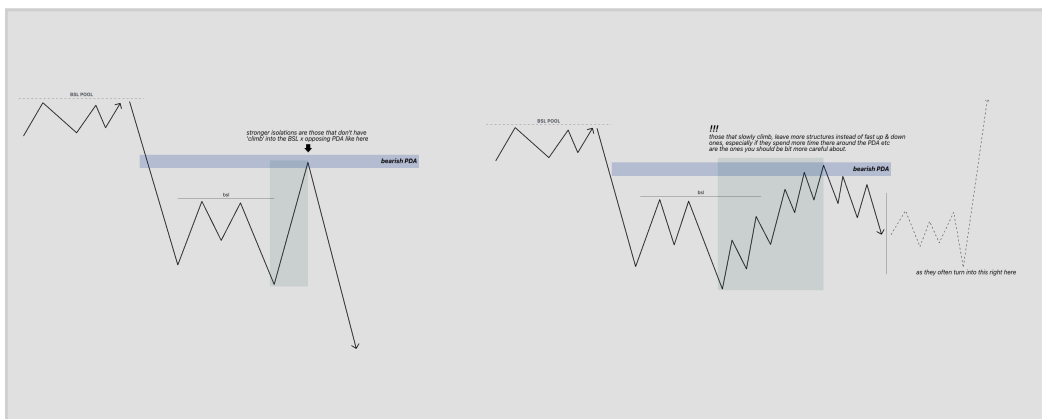

1hr TF

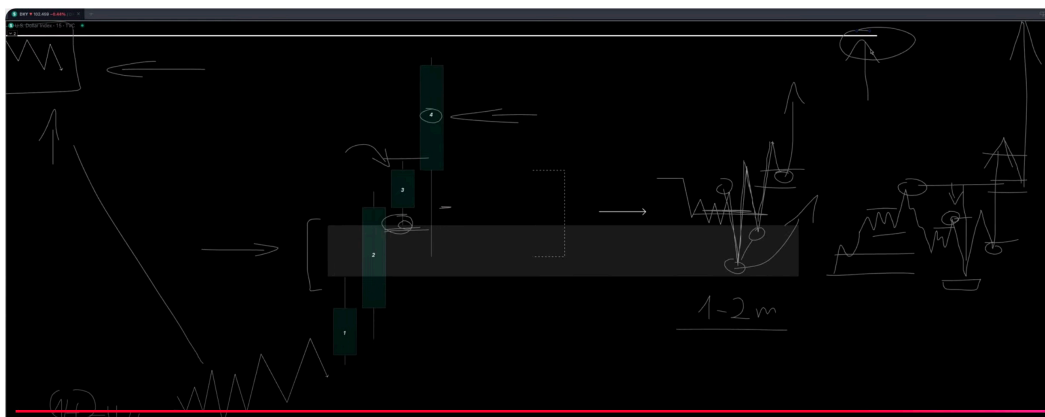

A full BOS you need to find the TF's dealing range. Dealing ranges are defined in a bearish example by marking up the last strong high to develop. What creates a strong high is a sweep of LQ before an expansion phase into a new low. The low of the dealing range is self explanatory

REGARDING THIS MONTHLY BULLISH CANDLE - IF PRICE CLOSES LIKE THIS , LEAVING A LITTLE WEEK AS BELOW , USUALLY PRICE WILL RETRACE BACK INTO IT AT LEAST 30% BEFORE CONTINUING UP AGAIN

GRINDING UP NO STRONG MOMENTUM WITH FVG'S

FOMC , MODEL IS THERE NOT QUITE MADE TO 4HR CE , PRICE BROKE DOWN GRINDING NO MOMENTUM
