LESSON - 10

Pay attention to what's important. In this lesson you will see the thinking process that goes on the Daily time-frame, where's the draw on Liquidity & how we build bias.

Daily Time-Frame

For us day-traders/scalp traders, the Daily TF will always be the one that will highlight the most important draw on liquidity. Our aim & goal is to identify where the price will be pushed towards in the next trading session/in the next trading day. We build Daily directional bias and expect for price to expand in that direction.

So, if we have bearish structure, price reaches a bearish PDA, rejects it – the Daily expansion will be in the same direction of the Daily draw on liquidity, once we have that question sorted out (the direction & the target) then we expect the intraday session volatility & momentum every day till draw on Liquidity areas are reached. So, if the draw on Liquidity is lower, and it's with the structure (and most ideally with the Weekly momentum) that's when we see those explosive, one-sided price moves in the London & New York kill zones. Why? – again, because they're blessed by the Higher TF's that are like a parent figure to the Lower TF's.

Daily Time-Frame

So, let's quickly go over this again - the Daily time-frame will highlight the most probable Draw on Liquidity, and that's where our direction prediction/bias come in.

Also, keep in mind that the day doesn't have to close bullish or bearish, it can give you an entry and push higher on London, give profit and reverse on NY - at that point you still caught the big chunk of that Daily move, and that's our main goal.

So, we're trading intra-day price moves per session inside that Daily range that's why the Daily candle doesn't necessarily has to close in the direction of the Daily Liquidity Pool, we just need to catch the momentum and the expansion towards it during the day, one price moves into late NYOKZ, London Close kill zone, etc., we don't really care how the end of the day forms and how the Daily candle closes as we've already banked our profit.

So, where is the Liquidity on the Daily TF resting?

It's not simply just yesterday's highs and lows, PDH & PDL is definitely the main target for that day if we're trading with the Daily momentum & direction, however, when we talk about the Liquidity on the Daily TF we must know where the price will push after the Previous Day's Liquidity is taken, we must understand the whole driving factor behind it all, and be able to see all the other potential Liquidity Pools that price will be drawn to, and that is not difficult to do if you put in some practise and apply the 20 Day IPDA Data Range approach.

EURUSD Daily TF

EURUSD Daily TF

We count back 20 trading days - that's where all the main Sellside draw on Liquidity is, and that's where our focus goes.

With every new candle your 20 day look back range moves one day to the right.

An example of the whole thinking process
when we analyse the Daily TF

BLESSED TRADER.

Your guide to consistency in the industry of fake.

What we have here is a clear bullish order flow, price is respecting bullish PDA's, and easily breaking through all the bearish PDA's.

BLESSED TRADER.

Your guide to consistency in the industry of fake.

One thing that we must notice here is that every time price reaches the bullish PDA, expansions are not as sharp, price pulls back immediately after every buy-side liquidity pool sweep - that's where we must pay close attention, especially when there're some clean sell-side liquidity targets lower.

BLESSED TRADER.

Your guide to consistency in the industry of fake.

What happens after two quick buy-side liquidity runs, price forms a structure break that helps us identify the potential dealing range.

BLESSED TRADER.

Your guide to consistency in the industry of fake.

***First Sellside Liquidity target
that our focus goes to.***

Why? – because below we have some imbalance
there and above we have some low resistance
liquidity (small candles just crawling higher,
no clear stop runs).

So, this is the main draw on Sellside Liquidity from
the Daily POV that sets the direction. From Lower TF POV
there of course are smaller targets to aim for, like session
lows, PDL, and so on.

Here our focus goes to the bearish PDA's that are now in place, where we will look for potential short opportunities during those trading days.

Remember - here we're analyzing the Daily TF, and how we build bias for the upcoming trading day/week.

*Notice that price pulls back from so to say -
"nowhere", that means that we don't have any
barriers towards our first sellside liquidity target.*

Bearish momentum kicks in right away. Price runs the Previous Day's High (BSLQ), into the bearish breaker, doesn't even reach the FVG, and starts expanding towards the first sellside liquidity target. Ideally, we would want to see a deeper retracement, however, when this happens and price wastes no time and starts expanding right away we look for lower TF's to align and then every day after the rejection the high probability plays are only to the downside, that's what we're waiting for - Lower TF's to align with the Higher TF bias, so our main focus is only the downside until it's reached or structure changes.

What price does - it falls straight to the sellside liquidity target, these two days where we would look for Lower TF opportunities to go short.

Also, don't forget about the 20 day IPDA data range, on the Lower TF's we would have those levels marked or at least pay attention to them and take partials along the way.

BLESSED TRADER.

Your guide to consistency in the industry of fake.

To not make our charts messy, we leave there only the main low as the Sellside target, however, we always keep in mind all the other Daily candle lows (20 day look-back).

From here, all the high probability plays are to the downside, targeting the sellside liquidity levels, Fair Value Gap & the bullish orderblock. So, our focus is to wait till Lower TF's align with the Higher TF bearish bias and focus on short opportunities aiming to catch clear Daily expansion candles.

This blue box represents the expansion towards the Discount levels where your main focus is looking for Lower TF's to align with your Daily TF bearish bias.

So, all those explosive Lower TF moves that you see will be happening to the downside with the Daily TF supporting this momentum, so that's where your main focus goes.

Once price starts heading into the bullish Discount PDA's like in this case, FVG & bullish orderblock, that's when we need to stop being overly aggressive with our bearish bias, look to take profits fast, and just step on the side lines to see if price reacts from there and if it does, we could be anticipating some potential bullish pullback opportunities.

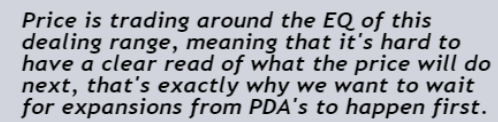

As a first opposing PDA we have a tiny FVG, then a buyside liquidity pool (low resistance high), and lastly this FVG that price left before expanding lower - all these bearish PDA's are our focus now, and we look for potential day trades to go long as that fits our Daily TF bias, however, we keep in mind that price is still currently in a bearish order flow till we see a shift or break in the structure.

After the price runs into the BSLQ, and aggressively trades away, all the focus is again on the downside and all the Sellside Liquidity Targets that are resting below.

Price reaches the first low, sweeps the SSLQ that is resting there (notice that quick bullish reaction after the SSLQ – 1 sweep, that's another example of when we take some quick scalp plays against the Daily momentum).

After the bullish retracement happens and price pulls into the FVG, we're back on the run targeting deeper SSLQ levels.
