

## TIPS AND GEMS!!!!!!!

- The first FVG inside the session is important. It will often act as a breakaway gap or an inverse gap that will be traded to later
- Market maker small 5/15 min models start when the Daily direction order flow gets exhausted. When exhausted go to 4hr time frame for levels
- Which 15min FVG to use? Look at 1hr OB
- In the last stages of MMM pull back will be quick and to the nearest order block
- @ICT When price is likely NOT to return to OB? = If we have a BPR above/below it
- When price enters external liquidity on the higher TF and hits our targets, our focus goes to the lower TF opposite liquidity levels (20day range/ the most focus on the last 5day range)
- Which FVG is highest probability? - the one that forms inside of the kill zone at specific time
- 4hr - is FVG strong? Did it form during key times?
- Did 1hr already filled this FVG?
- WHEN PRICE SITS ON A WEEKLY OPENING, DOES NOT TAKE LIQUIDITY BUT STARTS SHARPLY MOVE AWAY FROM IT WITH NICE LOWS/HIGHS AND FVG'S - ENTER

**Option A: Strong protraction, running liquidity (ideally into opposing PDA's and during one of the KZ's) leaving sharp/strong structure and ETF's shifting into clear order flow**

**Option B: Price giving a strong isolation, strong 31st L type of structure from where it is IF we can't trust the current price action (which is the case right now) again ideally during one of the KZ's**

**Option C: Looking for order flow to continue on the LTF's to the point where it wouldn't make sense for LTF's to drop all the way running LQ that's already far away**
